The lab required me to build a one-page ICT461 registration form with semantic HTML (header, fieldset/legend), responsive CSS, one JS interaction (live custom validation messages). The invalid/input listeners that swap browser-default error text for your own messages. The real challenge was figuring out how to make the <legend> accessible without visually duplicating your <h1>. Client checks alone aren't enough, hence if I had more time I would have refined that area.
